

Announcing Micron's Policy Proposal to Strengthen Communities Around the U.S.

Micron Technology appreciates the opportunity to work with the Administration and Congress on the challenging issues facing our nation, including the resiliency of our supply chain, a weakened economy that widens the digital divide and the systemic inequalities in our society. As one of the world's largest semiconductor companies, and the only remaining U.S. company that develops, manufactures, and sells leading edge memory and storage products, we understand that we have an important role to play in rebuilding the global economy.

The dream of technology isn't shaped by limitations. Technology has become the single most impactful element of modern life because technology embraces 'and' instead of 'or.' Many of us have devoted decades of our lives to the idea that technology can and should be able to do many things all at once – calculate and display, stream and project, rhyme and reason.

Today we are unveiling a new policy platform that uses information to drive our business **and** enrich life *For All*. We believe, and we intend to advocate for, our business interests, which include broader societal issues important for Micron's continued growth and the success of our team members. Micron is ready to partner with you on the three key areas below to drive meaningful change in our communities.

- **Investing in the Future of American** manufacturing and infrastructure by enhancing innovation to power a new generation of high-speed broadband, artificial intelligence, smart communities and securing American leadership in semiconductor research, development and manufacturing.
- **Advancing Technology for the Global Good**, using data insights to spur economic development and protect the environment in responsible ways.
- **Securing Data-Driven Justice** reform to ensure a more equitable and inclusive society *for all*.

We know this is a lot, and these ideas are both idealistic and a bit daunting, but we choose to be optimistic. After all, who would have thought a startup founded in the basement of a dentist's office in Boise, Idaho would grow to be the fourth largest semiconductor company in the world with over 40,000 top notch team members around the globe. By focusing on areas where Micron excels, we are committed to partnering with communities and government to begin to significantly move the needle on the issues that matter to us. To all of us.

Thank you. And see you soon.
